

Higher capacity, higher rate, longer life.

ZEON will be demonstrating its line of aqueous and NMP-based binders for Li-ion anodes and cathodes at AABC 2014. These binders provide improved electrochemical performance, require less amount of binder, and offer reduced overall cost as compared to cells made using PVdF. In the exhibition hall, ZEON will introduce its latest advancements for cathode binders and both water-based ceramic and polymer particle functional layer coatings.
